

Tip-Recommendations

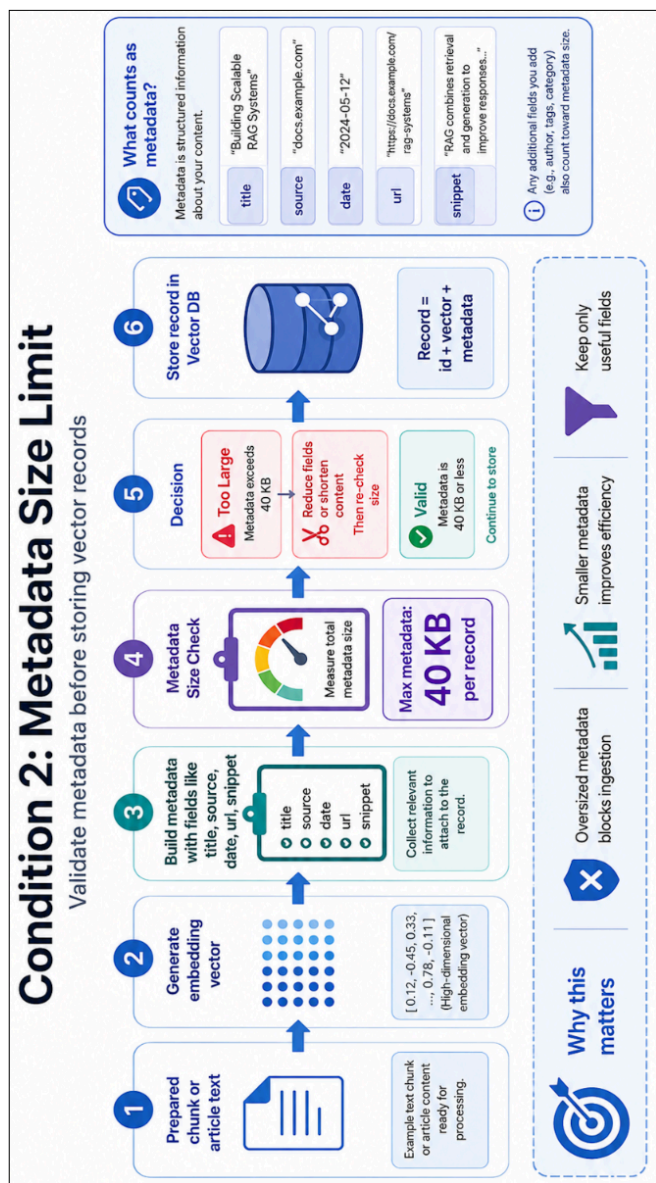

1. How do we calculate chunk size

So over all we can say that a chunk is the unit we pass to the embedding model to get embeddings where max no of chunk size as per opental model we can pass as 8192 tokens but this varies from model to model. So always remember to calculate the chunk size before you send to your embedding model for embeddings

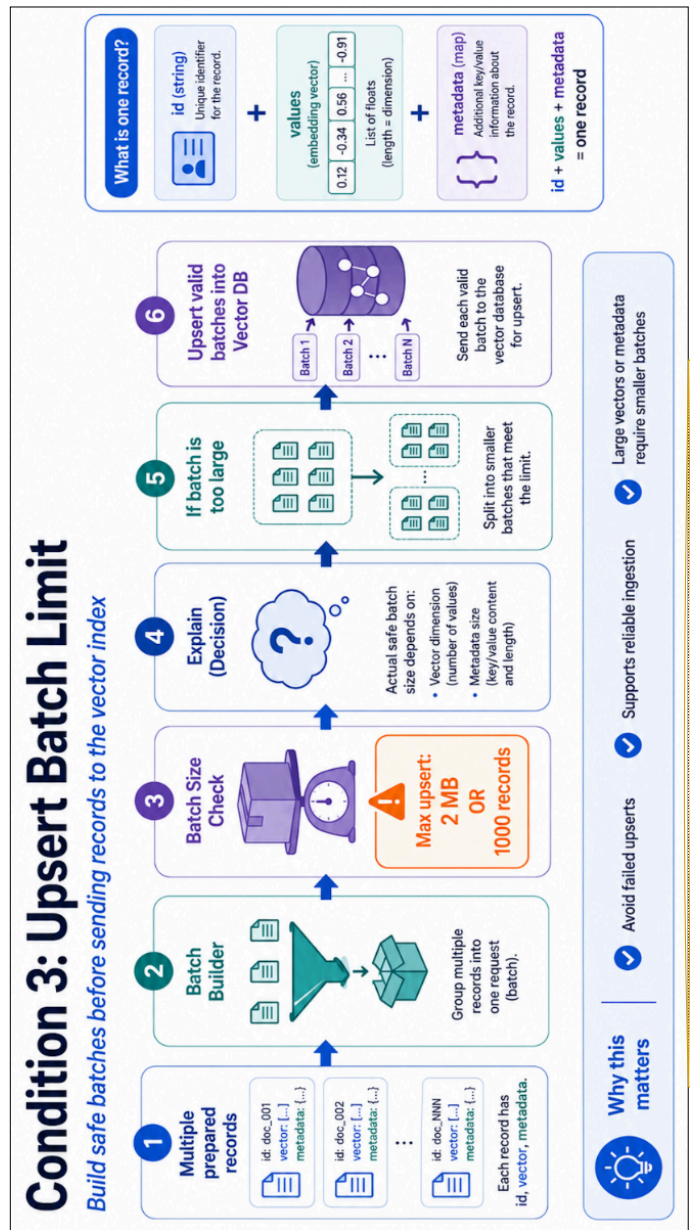

2.2. Limitations of vectordb index

<https://docs.ploneone.io/guides/index-data/indexing-overview#metadata>

3. Limitation of Upsert Batch Limit

<https://docs.pinecone.io/guides/index-data/upsert-data#upsert-limits>

Upper limits	
Metric	Level
2.4M and 2000000 with vectors	2.4M
2.4M and 2000000 with vectors	2.4M
Max document per client request	2.4M
Max document length in bytes	2.4M
Max "url", "text", "image", "string fields" per document	100
Max length per "url", "text", "image", "string field"	100000
Max length per "url", "text", "image", "string field"	100000
Max types per index	250 types
Max fields indexed in per document	4096
Max length of a stored ID	255 characters
Max document size for group clients	200000
Max size for search for group vectors	2048
Max size for search for sparse vectors	42 bytes

Upsert limits
