

Why we have to go with K8S ??

From the above architecture if you observe carefully all the containers are running in same virtual machine. If in case if your vm goes down then your application will go down. Hence we don't recommend going with docker.

What is a Cluster ??

A group of servers work together to achieve one common goal

What are the diff softwares we have which supports containerization platforms ?

1. Kubernetes (OpenSource)
2. Apache mesos
3. Redhat Openshift (Behind the scenes they use kubernetes)
4. Docker swarm
5. Managed Services:
 - AWS: Elastic Kubernetes Service (EKS)
 - AZURE: Azure Kubernetes Service(AKS)
 - GOOGLE: Google Kubernetes Engine(GKE)
 - RANCHER: Rancher Kubernetes Service
